

Advantages of small communication base stations

What is a small cell cellular base station?

A small cell is another type of cellular base station that is physically small -- around the size of a pizza box -- and transmits radio signals. The goal of small cells is to boost wireless network connectivity in specific areas, as small cells can enable mmWave frequencies with high-speed broadband connectivity.

How do small cells enhance Macro Communications Networks?

To enhance macro communications networks, small cells boost coverage in a specific area by adding targeted capacity. Small cells also support new services and deliver enhanced user experience (UX) by enabling high-speed wireless Broadband and all that entails to be available in more places.

What is a compact base station?

These compact cells possess all the essential features of traditional base stations (BSs) but offer a higher data rate for individual subscribers. They were introduced in 3GPP Release 9 specifications. Small cells are crucial for high-speed broadband and low-latency applications in LTE-Advanced and 5G NR deployments.

Why are base stations important in cellular communication?

Base stations are important in the cellular communication as it facilitate seamless communication between mobile devices and the network communication. The demand for efficient data transmission are increased as we are advancing towards new technologies such as 5G and other data intensive applications.

What are the properties of a base station?

Here are some essential properties: Capacity: Capacity of a base station is its capability to handle a given number of simultaneous connections or users. Coverage Area: The coverage area is a base station is that geographical area within which mobile devices can maintain a stable connection with the base station.

Why do we need a base station?

Technological advancements: The New technologies result in evolved base stations that support upgrades and enhancements such as 4G, 5G and beyond, its providing faster speeds with better bandwidth. Emergency services: They provide access to emergency services, so that in case of emergency, people can call through their mobile phones.
