

What types of energy storage can be aggregated?

The type of energy storage to be aggregated can be selected specifically to achieve an effective replacement of conventional power regulation resources. For example, base station batteries perform well in power regulation and are suitable for power applications such as frequency regulation.

What is aggregated reuse of multiple energy storage?

The first part is called "aggregated reuse of multiple energy storage", which refers to the aggregation of various types of energy storage resources for shared use. This part focuses on the "cloud" characteristic of energy resources and forms an energy storage resource pool which can be referred to as the energy storage "cloud".

Is VESS a shared energy storage aggregation method?

As an efficient aggregation method of distributed flexible resources, VESS provides another option for the expansion of the energy storage supply sources of CES. Although many studies on energy storage sharing point out the virtual nature of shared energy storage services, no study emphasizes the shared application of VESS.

Is energy storage system a viable solution for high-proportion renewable power integration?

Energy Storage System (ESS) has flexible bidirectional power regulation capabilities and has provided an effective means to address the challenges of high-proportion renewable power integration. However, hindered by many factors, the large-scale development and application of ESS still face many bottlenecks.

Can energy storage aggregators provide secondary frequency control services?

Under the premise of fulfilling the obligation of primary frequency control of wind and photovoltaic power stations, Ref. proposed a day-ahead optimal bidding strategy for energy storage aggregators of renewable energy stations to provide secondary frequency regulation services for the power grid.

What is decentralized reuse of aggregated energy storage?

The second part is called "decentralized reuse of aggregated energy storage", which focuses on the "cloud" characteristic of energy storage service and refers to the virtualized energy storage service provided through the aggregated energy storage facilities. Fig. 2.
