

Analysis of the working mode of energy storage container

What are the challenges in designing a battery energy storage system container?

The key challenges in designing the battery energy storage system container included: Weight Reduction: The container design had to be lightweight yet strong enough to withstand operational stresses like shocks and seismic forces, ensuring the batteries were protected during transport and deployment.

How does a containerized energy storage battery system work?

These ships are equipped with containerized energy storage battery systems, employing a "plug-and-play" battery swapping mode that completes a single exchange operation in just 10 to 20 min. Therefore, it can be used on the ship to achieve "separation of the ship's electricity" and improve the efficiency of power exchange.

Can CFD simulation be used in containerized energy storage battery system?

Therefore, we analyzed the airflow organization and battery surface temperature distribution of a 1540 kWh containerized energy storage battery system using CFD simulation technology. Initially, we validated the feasibility of the simulation method by comparing experimental results with numerical ones.

How does a container transport system work?

The container complies with the ISO standard. The system is installed in 20 ft, 40 ft and containers of other sizes according to the system size, and the containers can be combined together. In this configuration, the system can be transported by trailer on land and by container carrier over water (Figure 2).

How does a container design help reduce operational downtime & maintenance?

The design helped the client reduce operational downtime and maintenance efforts. The container met all relevant international standards, including ISO 1496-1, ISO 668 and IP54 Rating, giving client peace of mind and reducing operational risks.

What are the characteristics of a battery storage system?

The internal resistance remains unchanged during battery discharge [38, 39]; (3) The walls of the container do not transfer energy and matter to the outside world, and are considered adiabatic and non-slip wall; (4) The source of cooling air is stable and continuous, and the energy storage system operates under stable conditions.
