Do small cell base stations consume more power?

Base line small cell base station In cellular networks, to meet the increasing demand of high-data-rate for wireless applications, small cell BSs provide a promising and feasible approach but that consumes more power. The base line of small cell BSs is shown in Fig. 1.

Can a macro cell base station cover a large area?

Providers generally use one macro cell base station to cover an area. However, multiple small cells can be used to give you coverage in the same area. Small cells have a coverage range of 50-200 metres, can be installed inside residential and office buildings, and their antennas are never longer than 1.2 metres.

Why do small cells use low-powered 4G & 5G base stations?

These small cells commonly use low-powered 4G and 5G base stations designed to increase localized network capacity and improve coverage. However, with base stations deployed in small cell configurations, there is a risk of overlapping signal interference, which can reduce network capacity and degrade service quality.

How does a small cell base station communicate with a core network?

The small cell base station communicates with the core network over a high-speed backhaul connection. Core network: The core network manages the overall operation of the small cell network, including authentication, authorization, and routing of user traffic.

What are the functions of a small cell base station?

It includes various functions such as the User Plane Function (UPF), Control Plane Function (CPF), and Session Management Function (SMF). Transport network: The transport network provides the high-speed connectivity between the small cell base station and the core network.

What is a medium-range base station?

Medium-range base stations, which are adapted from microcell scenarios for Outdoor deployment. Small cells support various frequency bands defined by 3GPP [TS38.104], including FR1 and FR2 bands, which may be licensed, shared, or unlicensed, depending on deployment.
