Does distributed thermal energy storage improve network design and sizing?

These studies show that the thermal storage helps to reduce the source peak power and produces increased cost savings. However, the effect of distributed thermal energy storage on the network design, sizing and its investment costs are not studied.

What is the difference between centralized and distributed thermal energy storage?

Centralized vs distributed thermal energy storage. The centralized storage is the most widely used storage type. This is due to the fact that large storage volume reduces heat loss because of its good surface-to-volume ratio. Moreover, larger the storage size, cheaper the specific storage cost (EUR/m³).

Why do data centers need thermal energy storage systems?

By storing excess heat generated during sunny periods, it can be used for heating during colder months, ensuring a consistent and sustainable heat supply. Data centers generate significant amounts of heat, which can be captured and stored using thermal energy storage systems.

Can centralized storage reduce the cost of a district heating network?

Then, the district heating network is designed to supply heat to these buildings using Comsol Heat and Excel is used for storage calculations. The case study results show that the maximum network cost reduction using centralized storage compared to no storage case is 3.87% with 2 day storage capacity (2000 m³).

What is thermal energy storage?

Similar to storing any other product, thermal energy storage separates the time of production from the time of consumption. This means that heat can be stored when it is generated from sources such as Combined Heat and Power (CHP) plants, solar collectors, surplus wind electricity, and industrial processes.

Can a district heating system reduce heat output?

Turski and Sekret [6] used the buildings and district heating network as thermal energy storages to reduce the source power of the district heating system. Their results show that the heat output for central heating can be reduced by 14.8%.
