

Does outdoor power generation require an inverter

Should you buy an inverter generator?

It all depends on how you plan to use it and, ultimately, your willingness to pay more for better performance. As with a traditional portable generator, an inverter generator can power your home appliances and electronics when the electricity goes out.

Do I need an inverter?

The answer is yes when you're trying to decide whether or not you need an inverter. The inverter can power critical loads in your home, such as refrigerators, microwaves, televisions, and other appliances that need electricity to run. You can use generators to run these items even when the power goes out.

Should a generator and an inverter run together?

If you have both an inverter and a generator, your system should run simultaneously. Here are some reasons why: Running both together helps protect your home from power surges and fluctuations in voltage caused by brownouts or blackouts; generators create more consistent power than inverters do.

What makes a good inverter generator?

An inverter generator tends to deliver power that's "cleaner," with more consistent voltage, which is reflected in the power quality test in our ratings. All of the recommended models have earned our highest score for power quality, while some of the conventional generators that we recommend score slightly below that.

Are Inverter generators better than conventional generators?

Inverter generators outperform conventional generators in a variety of ways: They're quieter than traditional portable generators. They're more efficient, so they use less fuel. They deliver cleaner power, which can be important if you're plugging in sensitive electronic equipment or medical devices. They're compact.

Are Inverter generators safe?

An inverter generator also produces lower emissions than a conventional model, though you still need to take the same safety precautions by running one outdoors and well away from any dwelling. Similarly, most household appliances will work just fine on the power from a conventional generator.
