

Can geostationary satellite communications be used in oil & gas industry?

Before the past decade's advancements of terrestrial wireless technologies made them practical for use in the oil and gas industry, geostationary satellite communications (also known as fixed satellite service, or FSS) was used mostly for remote SCADA telemetry.

Can wireless communications improve oil & gas production?

In fact, wireless communications are already connecting remote oil and gas production facilities around the world, while enabling greater operational visibility, control and efficiency.

How many base stations does SCADA have?

With more than 120 base stations, the network provides multiple services, including SCADA telemetry, voice and video, not only from platforms-to-platforms and platforms-to-shore but also for approaching and departing supply vessels servicing those platforms.

What makes a high-performance wireless communication infrastructure a good choice?

Finally, remote and often unmanned facilities require that high-performance wireless communication infrastructures not only be rugged and secure, but also highly reliable - carrier-grade, that is - and simplified, to ease the engineering and maintenance burden on the producers' enterprise IT and operating engineering teams.
