What is a flywheel energy storage system?

First-generation flywheel energy-storage systems use a large steel flywheel rotating on mechanical bearings. Newer systems use carbon-fiber composite rotors that have a higher tensile strength than steel and can store much more energy for the same mass. To reduce friction, magnetic bearings are sometimes used instead of mechanical bearings.

What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

Why are high-strength steel flywheels a good choice?

High-strength steel flywheels have a high energy density (volume-based energy) due to their high mass density. Furthermore, they are superior to composite ones regarding thermal conductivity and design data availability, such as SN curves and fracture toughness.

How do you calculate the energy capacity of a flywheel?

The following equations describe the energy capacity of a flywheel: (2)  $E_m = \frac{1}{2} I \omega^2$  (3)  $E_v = \frac{1}{2} \rho V \omega^2$  where  $\phi$  is the safety factor,  $\delta$  the depth of discharge factor,  $\gamma$  the ratio of rotating mass to the total system mass,  $\sigma$  the material's tensile strength,  $K$  the shape factor, and  $\rho$  the density.

What is a 30 MW flywheel grid system?

A 30 MW flywheel grid system started operating in China in 2024. Flywheels may be used to store energy generated by wind turbines during off-peak periods or during high wind speeds. In 2010, Beacon Power began testing of their Smart Energy 25 (Gen 4) flywheel energy storage system at a wind farm in Tehachapi, California.
