

How Solar Energy Plus Energy Storage Cabinet Works

What is a solar-plus-storage system?

Simply put, a solar-plus-storage system is a battery system that is charged by a connected solar system, such as a photovoltaic (PV) one. In an effort to track this trend, researchers at the National Renewable Energy Laboratory (NREL) created a first-of-its-kind benchmark of U.S. utility-scale solar-plus-storage systems.

Can PV and battery storage be co-located?

When PV and battery storage are co-located, they can be connected by either a DC-coupled or an AC-coupled configuration. DC, or direct current, is what batteries use to store energy and how PV panels generate electricity. AC, or alternating current, is what the grid and appliances use.

Why are solar panels important?

Solar panels have one job: They collect sunlight and transform it into electricity. But they can make that energy only when the sun is shining. That's why the ability to store solar energy for later use is important: It helps to keep the balance between electricity generation and demand.

How do lithium ion batteries store energy?

Lithium-ion batteries are one way to store this energy--the same batteries that power your phone. Why lithium? There are many ways to store energy: pumped hydroelectric storage, which stores water and later uses it to generate power; batteries that contain zinc or nickel; and molten-salt thermal storage, which generates heat, to name a few.

How many energy storage systems are there in the US?

According to GTM Research's "U.S. Energy Storage Monitor 2017 Year in Review," more than 5,500 energy storage systems are installed in the U.S., in the residential and commercial sectors with over 95% connected to PV in the residential sector at the end of 2017, which amounts to about 4,700 systems.
