How many types of base stations are there?

Macro cell, Micro cell, Pico cell and Femto cell are 4 types of base stations in wireless communication networks. Macrocell antennas must be properly mounted on ground-based masts, rooftops or other existing structures and at heights for an unhindered, clear view of the surroundings.

Do base stations need a power supply?

Power supply: The base station requires a power supply to operate. It may be connected to the electrical grid or have a backup power source like batteries or generators in case of power outages. 7. Backhaul connection: The base station needs a backhaul connection to connect to the core network.

What is a base station in a cellular network?

A base station, also known as a cell site or cell tower, is an integral part of a cellular network. It serves as a central hub for communication between mobile devices and the network infrastructure. Here is a simplified explanation of how a base station works: 1.

What are the components of a base station?

Power Supply: The power source provides the electrical energy to base station elements. It often features auxiliary power supply mechanisms that guarantee operation in case of lost or interrupted electricity, during blackouts. Baseband Processor: The baseband processor is responsible for the processing of the digital signals.

What are the properties of a base station?

Here are some essential properties: Capacity: Capacity of a base station is its capability to handle a given number of simultaneous connections or users. Coverage Area: The coverage area is a base station is that geographical area within which mobile devices can maintain a stable connection with the base station.

How to choose a base station?

Frequency: The base station should operate on a frequency that is compatible with the devices it will be communicating with. Common frequencies include 900 MHz, 1.8GHz, 2.1GHz, 2.4 GHz, 2.6GHz and 5 GHz, etc. 3. Power: The base station should have enough power to provide a strong and reliable signal.
