Can a 48V inverter be rated at 2 kVA?

In this post I have explained a simple 48V inverter circuit which may be rated at as high as 2 KVA. The entire design is configured around a single IC 4047 and a few power transistors. I am a big fan of u....i am a wisp. i need an inverter design with 48volt DC input and 230volt output supply and output power in the range up to 500w.

How to calculate dc power / voltage / current / resistance?

Watts (W) - volts (V) - amps (A) - ohms (?) calculator. Calculates dc power / voltage / current / resistance. Enter 2 values to get the other values and press the Calculate button: Ohm's law calculator ? The resistance R in ohms (?) is equal to the voltage V in volts (V) divided by the current I in amps (A):

Is 20R a good voltage for a 48V inverter?

20R at 48V is about 2.5A or therabouts,I'd suggest that will be just fine,give it a suitably rated switch and you're good to go. You're just trying to avoid that massive (almost infinite) current splat when you first connect the discharged inverter. The Seplos 48V BMS has a 51R 10W pre-charge resistor for about 1A pre-charge.

How much power does a 50V resistor have?

If you have 50v and five ohms,the instantaneous power  $E^2$  on R,or is 500 watts. Now it depends upon the thermal mass of the resistor,and how well it can sustain that kick in the guts,and for how many times. It might only be for a few milliseconds.

How many ohms should a 48 volt system have?

For a 48v system about six ohmsas suggested previously might be about right. The thing you need to seriously think about is the flash heat dissipation when you suddenly hit the pre charge button. Six ohms and 56 volts is only 9.3 peak amps. But that is also 522 peak watts of pretty explosive heat release (but only for an instant).

How much current does a 20R inverter need?

Thailand,just north of Bangkok. 20R at 48V is about 2.5Aor therabouts,I'd suggest that will be just fine,give it a suitably rated switch and you're good to go. You're just trying to avoid that massive (almost infinite) current splat when you first connect the discharged inverter.

Because I don't know how much current the wire coming from the display can deliver 48v battery was intentional, to achieve a higher pedal RPM - plan B is to just buy a 48v controller however ...

Yes. It's called Watt's Law.  $120v \times 12a = 1440w$   $1440w / 36v = 40a$  (assuming 100% efficinecy, so in reality
