What is balancing lithium battery packs?

Balancing lithium battery packs, like individual cells, involves ensuring that all batteries within a system maintain the same state of charge. This process is essential when multiple battery packs are used together in series or parallel configurations.

Why is a lithium battery pack designed with multiple cells in series?

Contributed Commentary by Anton Beck, Battery Product Manager, Epec When a lithium battery pack is designed using multiple cells in series, it is very important to design the electronic features to continually balance the cell voltages. This is not only for the performance of the battery pack, but also for optimal life cycles.

Why is battery balancing important?

This balances the cells and prevents any one cell from moving too far out of sync from the overall battery pack voltage. Proper balancing keeps all cells operating at optimal capacity and safety throughout the life of the battery.

Why is balancing a lithium battery important?

In lithium batteries, maintaining balance is crucial because it allows for the most efficient use of the battery's total capacity. It also prolongs the battery's lifespan by preventing overcharging or over-discharging of individual cells.

How to balance lithium batteries in parallel?

Balancing lithium batteries in parallel involves measuring each battery's voltage before connection, ensuring they're within an acceptable range of each other, and then connecting all positive and negative terminals together. What Does It Mean For Lithium Batteries To Be Balanced?

How does a battery balancer work?

Battery balancers and battery management systems continuously monitor voltages and redistribute energy by shuffling power between cells to keep them all at the same state of charge. This balances the cells and prevents any one cell from moving too far out of sync from the overall battery pack voltage.

For example, a lithium-ion battery will drop from around 4.2V (fully charged) down to 3.7V, then further to 3.0V (cut-off voltage), after which the device will stop working. During ...
