

Lithium-ion energy storage power station design

What are battery storage power stations?

Battery storage power stations are usually composed of batteries, power conversion systems (inverters), control systems and monitoring equipment. There are a variety of battery types used, including lithium-ion, lead-acid, flow cell batteries, and others, depending on factors such as energy density, cycle life, and cost.

What is a utility scale lithium-ion battery energy storage system?

Utility Scale Lithium-ion Battery Energy Storage Systems take excess energy from renewable energies or conventional power plants to charge up the large lithium-ion batteries. Our client has specified that we will design a 25 MW, 4 hr system. The system will have a 30-year life cycle and two augmentations throughout its lifetime.

How to design a battery energy storage system?

One of the most essential parts of designing a battery energy storage system is the electrical connections between components. This concept is illustrated with a one-line diagram. The one-line diagram includes every connection, from the substation to the main power transformer, the inverters, the batteries, and the auxiliary power.

What types of batteries are used in a battery storage power station?

There are a variety of battery types used, including lithium-ion, lead-acid, flow cell batteries, and others, depending on factors such as energy density, cycle life, and cost. Battery storage power stations require complete functions to ensure efficient operation and management.

Why do battery storage power stations need a data collection system?

Battery storage power stations require complete functions to ensure efficient operation and management. First, they need strong data collection capabilities to collect important information such as voltage, current, temperature, SOC, etc.

What are the disadvantages of a lithium-ion battery energy storage system?

Another disadvantage is that lithium-ion batteries degrade in capacity relatively quickly. This makes the project more expensive through overbuilding at BOL and augmentations throughout its life. Since we started working with Burns and McDonnell on the battery energy storage system, we have completed many steps of the process.
