

Market price of user-side energy storage power stations

Do users participate in Energy Storage pricing?

Thirdly, research on the user-side is mainly limited to residential area users, while there is limited research on users who can configure energy storage devices themselves, such as industrial users, without considering the initiative of such users to participate in energy storage pricing.

What is user-side shared energy storage?

User-side shared energy storage is composed of interconnection and mutual benefit of adjacent energy storage devices in the same area, so the power loss in the power interaction process can be ignored [17].

Is user-side energy storage a waste of resources?

However, the disorderly management mode of user-side energy storage not only causes a waste of resources, but also brings hidden dangers to the safe operation of the power grid, such as stability, scheduling and operation, power quality and other problems.

What is user-side distributed energy storage?

The user-side distributed energy storage will keep part of the stored power for self-use. At the same time, they will sell the remaining idle power to energy storage operators through the cloud energy storage service platform to earn additional revenue.

Why is shared energy storage important?

However, the development of sharing economy in recent years has promoted the generation of shared energy storage, which not only smooths out the fluctuation of renewable energy but also is widely used in power system peak and frequency regulation, providing a reliable guarantee for power system supply and demand balance.

What is the difference between energy storage and energy grid?

In contrast to energy storage operators, the grid is able to purchase electricity at a lower price from energy storage operators during peak periods, which not only alleviates the circuit collapse caused by high circuit load during peak periods, but also ensures normal electricity consumption by users and avoids large-scale power outages.
