What is an environmental stress screen ESS test?

ESS tests are widely used in both military and civilian programs as efficient and effective ways to ensure the safety and performance of finished electronic products. What is the difference between HASS and ESS?

What is environmental stress screening?

Environmental stress screening (ESS) is also known as Burn-in,AST (Accelerated Stress Testing),HALT (Highly Accelerated Stress Test),or HASS (Highly Accelerated Stress Screening). Whatever the name,the idea is the same: create a test program that allows you to eliminate the infant mortality of your product.

What is ESS testing?

ESS refers to exposing a newly manufactured product to stresses,such as thermal cycling and vibration,to force product defects or production flaws during the screening process. ESS testing aims to reveal any hidden defects by applying accelerated environment stresses.

Why should you conduct ESS tests on new products?

Conducting ESS tests on new products enables the manufacturer to correct any flaws that would otherwise have affected reliability. At Nemko,we can develop the right ESS program for you and perform the testing in a timely fashion to prevent delays in the shipment of your product.

Can delserro engineering solutions perform environmental stress screening test?

Click [here](#) to view our case study. Delserro Engineering Solutions is capable of performing environmental stress screening testto commercial or military specifications which will uncover flaws in products when exposed to challenging environmental stresses. Give us a call at 610-253-6637.

Why should ESS testing be conducted early?

Planning should begin early to ensure a successful testing process because testing conducted early in the process has more cost-saving potential. Conducting ESS testing can reduce costs and improve profits. ESS is regarded as a cost-effective quality control process and produces a high return on investment.
