What is the minimum inertia demand of a photovoltaic energy storage system?

In a regional power grid, based on the operating conditions and system model, if the estimated disturbance power does not exceed 10 % of the total capacity, i.e., $P_d = 0.1 \text{ pu}$, the minimum inertia demand of the photovoltaic energy storage system can be obtained in this case, when the maximum allowable rate of change of frequency is set. Fig. 2.

How can a photovoltaic energy storage system provide efficient frequency support?

To ensure that the photovoltaic energy storage system provides efficient frequency support and power oscillation suppression, the virtual inertia and virtual damping parameters of the VSG should be coordinated based on system frequency safety and damping ratio constraints.

Should a photovoltaic energy storage system be monitored in real time?

Therefore, in the case of no change in the operation structure of the grid, there is no need to monitor the natural frequency ω_n of the photovoltaic energy storage system in real time, which is conducive to the promotion and application of the control strategy in the power system at this stage.
