Why do telecom companies use a grounded positive 48VDC system?

But these systems are always equipped with ground detection for both the positive and negative sides. If properly monitored, the ground can quickly be located and repaired. Also the telecom industry uses a grounded positive 48Vdc system. I believe this practice dates back over a 100 years ago (and had something to do with corrosion?).

What happens if you oversize a base station wire?

Since an automotive environment is hotter than a base station one, over-sizing the wire (less resistance) will keep temperature rise to a minimum. Too high a temperature rise, and the insulation could melt (pyrolysis). Minimal voltage drop is even more important if you're using an amplifier.
