

Can fuel cell backup power systems provide grid services?

This paper presents the feasibility and economics of using fuel cell backup power systems in telecommunication cell towers to provide grid services (e.g., ancillary services, demand response). The fuel cells are able to provide power for the cell tower during emergency conditions.

What is the main source of power for a base station?

In the case of base stations situated in regions with bad-grid or off-grid power availability, the predominant source of power for the base stations is diesel generators. [4,6] Diesel generation is costly in both the procurement of fuel and travel required to maintain adequate fuel levels at the base stations.

What are the primary sources of power for a mobile base-station?

The primary sources of power for these mobile base-station vary by region and can generally be categorized into 3 buckets: Reliable grid power: AC mains or grid power can reliably serve as the primary power supply.

How can backup fuel cells respond to grid demand?

Small backup fuel cells can be aggregated in concert to react to grid demand, and may reduce grid congestion in some densely populated areas where demand could fluctuate significantly at times. The quick response of PEMFC to power demand can provide reliable power supply for telecommunications and other critical facilities.

Are fuel cell power systems a viable alternative power supply technology?

Clean and efficient fuel cell power systems have shown great potential as an alternative power supply technology for distributed energy resource (DER) needs. They are also attractive for telecommunications companies that want to avoid prolonged power outages and disruption of service to their customers.

Can a fuel cell backup power system be used for telecom applications?

Other than the added cost of the fuel cell backup power system, no obvious hurdles--considering technique, installation, and operation--exist in deploying such a system for telecom applications. The hydrogen level may be monitored remotely to allow the user to maintain the fuel supply.
