What is the recoverable energy storage density of PZT ferroelectric films?

Through the integration of mechanical bending design and defect dipole engineering, the recoverable energy storage density of freestanding  $\text{PbZr}_{0.52}\text{Ti}_{0.48}\text{O}_3$  (PZT) ferroelectric films has been significantly enhanced to  $349.6 \text{ J cm}^{-3}$  compared to  $99.7 \text{ J cm}^{-3}$  in the strain (defect) -free state, achieving an increase of 251%.

Can ultra-thin multilayer structure improve energy storage performance of multilayer films?

In this study, an innovative approach is proposed, utilizing an ultra-thin multilayer structure in the simple sol-gel made ferroelectric/paraelectric  $\text{BiFeO}_3/\text{SrTiO}_3$  (BF/ST) system to enhance the energy storage performance of multilayer films.

How to improve energy storage performance of multilayer films?

Current methods for enhancing the energy storage performance of multilayer films are various, including component ratio tuning, interface engineering, diffusion control, stress manipulation, and conduction mechanism modulation.

How can flexible ferroelectric thin films improve energy storage properties?

Moreover, the energy storage properties of flexible ferroelectric thin films can be further fine-tuned by adjusting bending angles and defect dipole concentrations, offering a versatile platform for control and performance optimization.

Does ultra-thin  $\text{BiFeO}_3$  film improve energy storage performance?

Ultimately, in the ultra-thin  $\text{BiFeO}_3$  film, with each layer having a thickness of 6.7 nm, we achieved a remarkable enhancement of energy storage performance, with  $W_{\text{rec}}$  reaching  $65.8 \text{ J cm}^{-3}$  and efficiency reaching 72.3%.
