How can energy storage system reduce the cost of a transformer?

Concurrently, the energy storage system can be discharged at the peak of power consumption, thereby reducing the demand for peak power supply from the power grid, which in turn reduces the required capacity of the distribution transformer; thus, the investment cost for the transformer is minimized.

What is a flexible energy storage power station (fesps)?

Firstly, this paper proposes the concept of a flexible energy storage power station (FESPS) on the basis of an energy-sharing concept, which offers the dual functions of power flow regulation and energy storage. Moreover, the real-time application scenarios, operation, and implementation process for the FESPS have been analyzed herein.

What is energy storage/reuse based on shared energy storage?

Energy storage/reuse based on the concept of shared energy storage can fundamentally reduce the configuration capacity, investment, and operational costs for energy storage devices. Accordingly, FESPS are expected to play an important role in the construction of renewable power systems.

How does a PV system satisfy a load?

Consequently, the PV system fully satisfies the load's power demand and any surplus of power will be stored in the battery. From  $t = 1.2s$  to  $t = 2s$ , the power generated by the PV system is lower than the load power requirement, and this depends on the level of irradiation.

How does a PV system work?

PV systems connect to the high-voltage DC bus through a bidirectional converter, this allows the load power supply to be controlled to meet the required power demand [43,44]. The converter consists of the electrical energy storage voltage (EESV), an inductor  $L$ , a capacitor  $C$ , and switches ( $S1, S2$ ) for the battery, and  $S3, S4$  for the SC.

What is the operation process of power flow regulation and shared energy storage?

The operation process of power flow regulation and shared energy storage of bus 1 after obtaining the solution to the bilevel optimization operation model is depicted in Fig. 9. During the periods of 01:00-05:00 and 23:00-24:00, the load is jointly supplied by the power flow transfer and the superior power grid.

With the increasing expansion of renewables, energy storage plays a more significant role in balancing the contradiction between energy supply and demand over both ...
