What is the life expectancy of a power supply?

No general answer can be given. Well, the power supplies' heating is usually much higher at 90% than at 80% and extremely high at 100%. So considering heating, it's usually good not to put more than 80% load on the supply for longer periods. Life expectancy is not really equal to MTBF!

What determines the service life of a power supply?

Power density demands are increasing, and electrolytic capacitors are the only component in the power supply that wears out. So, the type of electrolytic capacitor used in the design determines the service life of the power supply. It also dictates the service life or service interval of the end application in maintained equipment.
