

The power station s new solar photovoltaic panels

What is a photovoltaic power station?

The design and function of a photovoltaic power station represent the height of green design and energy transformation. It has the perfect mix of solar panel arrays, photovoltaic cells, and advanced technology. Together, they capture and use solar energy effectively. At the center of the power plant's design are large solar panel arrays.

How do photovoltaic power stations work?

Photovoltaic power stations have a large number of electrically interconnected photovoltaic modules that make up so-called strings, which are connected to each other in parallel as well as to an inverter to supply electric current. Solar radiation is captured by all the solar panels in a power station's photovoltaic array.

What are photovoltaic modules?

Photovoltaic modules are made up of a mosaic of solar cells. Here is a description of their main features and of Enel Green Power's innovative solution. There aren't any solar panels at a thermodynamic plant, also known as a concentrated solar power station.

Are photovoltaic power stations a good idea?

Using photovoltaic power stations is key for a clean energy future. They cut down greenhouse gas emissions and fight climate change. They offer renewable energy, meeting demand without using up natural resources. What innovations are shaping the future of photovoltaic power stations?

What is a solar PV power plant?

Solar PV power plants consist of several interconnected components, each playing a vital role in converting solar energy into usable electricity. Comprised of photovoltaic cells made of silicon, these panels capture sunlight and initiate the photovoltaic effect.

How many types of solar power stations are there?

There are two types of solar power stations: photovoltaic and thermodynamic/concentrated. Photovoltaic plants take advantage of the photovoltaic effect to produce electricity, i.e. the ability of some semiconductor materials (when properly handled) to generate electricity when exposed to light rays.

Combined with the 120 kilowatts from the new roll-out panels, that will bring the space station's total power production capacity to 215 kilowatts.
