

# Weak light photovoltaic panels and prices

How does a weak euro affect photovoltaic product prices?

The weak euro makes imported photovoltaic products more expensive throughout the entire value chain. In addition, delivery bottlenecks have resulted - even in the case of standard modules from major manufacturers - due to increased demand triggered by mild temperatures at the beginning of this year.

Are photovoltaic module prices stagnating?

While module prices for non-EU projects are in the lower 40 eurocent range, prices within the European Union are stagnating just above the 50 eurocent mark.

How does the minimum price regulation affect the photovoltaic market?

The minimum price regulation paralyzes the European photovoltaic market by preventing a downward price adjustment for solar modules and cells of all regions of origin. Despite this, prices remain largely stable.

Why are photovoltaic products so expensive?

The high demand for photovoltaic products, especially at the beginning of this year, has led to delivery bottlenecks and increased prices. This is due to mild temperatures and the weak euro, which makes imported products more expensive throughout the entire value chain.

Is the European photovoltaics market recovering?

The European photovoltaics market has not yet lived up to expectations after the strong increase in installation figures in late 2016. Although there has been an overall revival compared to the first quarter of last year, the market has still failed to really take off.

Are photovoltaic modules going up in Europe?

In Europe, the price increase for photovoltaic modules is not quite as strong as expected, at least until now. In particular, thin film module prices remained relatively stable, with March showing barely any movement.
