What is inside a nuclear power plant?

Inside a Nuclear Power Plant - Nuclear power plant design depends on a containment structure, cooling systems and a steam turbine. Learn how nuclear power plants work.

What is a nuclear containment building?

Preventing radioactive release: The containment building serves as the final barrier to prevent the release of radioactive materials from a nuclear reactor. Other barriers including the ceramic fuel pellets, the metal fuel cladding tubes, and the reactor vessel.

How do power stations use water?

Intake & Outfall: Some power stations, typically ones located close to very large bodies of water, will suck up water and use it to extract heat from steam via a heat exchanger. Then, the heated water is simply released back into the source. This is usually done using pipelines or tunnels. Is the water radioactive?

What is a control room in a nuclear plant?

Control Rooms: Control rooms where operators monitor and manage reactor systems, safety protocols, and emergency responses. Meeting Rooms: Meeting spaces for discussions, briefings, and planning sessions. Training Facilities: Training rooms where staff receive ongoing training related to nuclear safety, emergency procedures, and plant operations.

A turbine is a large machine that spins and harvests the surrounding energy. In wind turbines, wind energy provides kinetic energy, which is then gathered by the turbine and ...

A septic tank typically consists of a large, watertight container buried underground, designed to hold and treat wastewater from toilets, sinks, and other household drains. The ...
