

# What is the maximum grid-connected power of a communication base station inverter

What is the output power of a base station?

Output power of the Base Station is the mean power delivered to a load with resistance equal to the nominal load impedance of the transmitter. The maximum total output power,  $P_{max}$ , of the Base Station is the mean power level measured at the antenna connector during the transmitter ON period in a specified reference condition.

What is the maximum carrier output power?

The maximum carrier output power,  $P_{max,c}$  of the Base Station is the mean power level measured at the antenna connector during the transmitter ON period for a specific carrier in a specified reference condition.

How does a grid forming inverter work?

Grid-forming inverters can start up a grid if it goes down--a process known as black start. Traditional "grid-following" inverters require an outside signal from the electrical grid to determine when the switching will occur in order to produce a sine wave that can be injected into the power grid.

Why is reactive power important in a grid service inverter?

Reactive power is one of the most important grid services inverters can provide. On the grid, voltage-- the force that pushes electric charge--is always switching back and forth, and so is the current--the movement of the electric charge. Electrical power is maximized when voltage and current are synchronized.

How do grid-following inverters work?

Traditional "grid-following" inverters require an outside signal from the electrical grid to determine when the switching will occur in order to produce a sine wave that can be injected into the power grid. In these systems, the power from the grid provides a signal that the inverter tries to match.

What are grid services inverters?

For instance, a network of small solar panels might designate one of its inverters to operate in grid-forming mode while the rest follow its lead, like dance partners, forming a stable grid without any turbine-based generation. Reactive power is one of the most important grid services inverters can provide.

The maximum total output power,  $P_{max}$ , of the Base Station is the mean power level measured at the antenna connector during the transmitter ON period in a specified reference condition.
