

Wind power generation phase change cooling system

Can high-power electronics be cooled in wind turbines?

To address the unique challenges of cooling high-power electronics in wind turbines, Parker Hannifin (Precision Cooling Systems) has developed a compelling alternative.

Do wind turbines need a water cooling system?

Key components in wind turbines, such as gearboxes, generators, converters and power packs, become less effective as they heat up during use. So keeping them at the right temperature is crucial if you want to get the best performance out of your wind turbine. Water cooling systems are pressurised and require a sealed expansion tank.

Which wind turbine is cooled by a Heatex closed-loop cooling system?

GE Renewable Energy's Haliade-X, one of the most powerful wind turbines in the world, is cooled by a Heatex custom-made closed-loop cooling system. Read Case Study CSIC HZ Windpower's 10MW H210-10.0 turbine is now in full serial production and operating outside the coast of Shandong in China. Read Case Study

Is air cooling a good idea for a wind turbine?

Air-cooling has served small-scale wind turbines well over the years, but has proven impractical when trying to remove the heat produced in a Megawatt-scale system. The thermal capacity of air being so low simply makes it difficult to blow enough air across a motor or through the converter to maintain reliable operating temperatures.

Why do wind turbines need a cooler?

Key components in your wind turbines become less effective as they heat up during use. Keeping your gearboxes, generators, converters and power packs at the right temperature is crucial if you want to get the best performance out of your wind turbine. We design, manufacture and test the coolers at our facility.
